

## Malocclusion and Tooth Wear

Heart disease is common in America.

Hypertension is common in America.

Obesity is common in America.

Would you not agree that all the above statements are true?

Just because something is common does not mean that it is healthy or normal!

Enamel attrition (excessive tooth wear) is all too common in America, millions of adult Americans suffer from some level of tooth attrition. Most of these people also have one or more of the following:

- Chipped teeth
- Gum recession
- Headaches
- Jaw joint (TMJ) pain and / or popping in the jaw joint
- Unexplained tooth loss

More than ever before more and more people are losing their teeth from simply wearing them down.

- Your teeth do not have to wear with age
- Your gums do not have to recede with age
- Your teeth can and should remain youthful in appearance your entire life...
- Your jaw does not have to pop, click or be uncomfortable
- You do not have to suffer from headaches

The good news is that there is an exact and predictable way to diagnose and treat this disease that is affecting so many people. The results we are achieving are phenomenal! My philosophy of dentistry is simple. I believe that dental disease is 100% preventable and, in most cases, 100% treatable or controllable. We have the choice of being healthy or not. Our focus is to educate and serve those who are willing to accept responsibility in a partnership for their better health. This is where true health and freedom from dental pain can occur.
